

QRoll

Scan. Verify. Attend.

The complete user manual — for lecturers, organisers, administrators and students.

1. What QRoll is

- QRoll is a QR-code attendance system for lectures, labs, tutorials, meetings, conferences and any other gathering where you need a fast, tamper-resistant record of who was present.
- Every participant gets a unique, permanent QR code. You either scan their codes with your phone or project a single session QR code on screen and let them check themselves in from inside the room.
- All data is private to your account: you only ever see the students, courses, sessions and reports that you created.

2. Getting started

Create an account

- Open the app and tap **Get started**. Sign up with email and password, or continue with Google.
- You can later link Google to the same account from **Account Settings**, so both sign-in methods reach the same data — no duplicate accounts.

Your 14-day trial

- New accounts start on a 14-day free trial. Plans and billing are managed on the **Billing** page.

Navigation

- Tap the menu button (top-left) to slide the navigation drawer in or out. It holds Dashboard, Students, Courses, Departments, Sessions, Scanner, Reports, Portal links, Billing, Settings, and the Help & Legal links.
- Every page has a **Dashboard** button to return home.

3. Dashboard

- The dashboard is your overview: total students, courses, open sessions and recent attendance activity. Cards are tappable shortcuts to the matching page.

4. Departments and academic years

- Add the departments/programmes you teach, and the academic year(s) you are running. Both can be edited or deleted at any time.
- When you import students, the *Department* or *Programme* column in your file is matched automatically to these records.

5. Students

Adding students

- Add one student at a time with **Add student**, or use **Import** to upload an Excel/CSV file.
- The importer is tolerant: column headings can be in any order or letter case, and extra columns are ignored. It recognises name, index number, email, level, department and programme columns.

- A second import pass can be used to add e-mail addresses to students who are already in the system — QRoll matches them by name.

Levels (classes)

- Students are grouped into levels/classes (100, 200, 300, 400 by default). You can add your own levels (500, 600, Staff, Cohort A ...) and delete levels you no longer need. Deleting a level asks for confirmation first.

QR codes

- Each student gets a permanent unique QR code. Tap the QR icon on a row to view it, print it, or e-mail it to the student.
- Students can also fetch their own code from the Student QR Portal (section 10).

Export & bulk delete

- **Export** asks which level you want, then downloads just that class.
- **Delete all students** is available but requires a double confirmation — it permanently removes students, their QR codes, registrations and attendance.

6. Courses and rosters

- A course belongs to a level, so a course created for Level 200 cannot be used for a Level 300 session.
- The **Roster** button shows every student registered for that course. Students are added to a roster automatically the first time they are scanned or check in for one of its sessions.
- Courses can be edited or deleted.

7. Sessions

Creating a session

- Create one session per course and reuse it — you do not create a new session every day. Each day's attendance is recorded separately under its own date, and reports label them by week (W1, W2, W3 ...).

Attendance modes

- **Single scan** — one scan marks the person present.
- **In / Out** — a check-in scan and a check-out scan. A check-out is refused within 30 minutes of check-in to prevent instant sign-outs.

Open and close

- An open session runs for 12 hours unless you close it manually. Closed sessions can be reopened.
- Deleting a session warns you to save its reports first, because all of its weeks are removed with it.

8. Scanner (staff scanning)

- Open **Scanner**, pick the session and tap **Start scanning** (browsers require this tap before the camera can start).

- Codes are detected automatically — you never have to press a button per student. Duplicates in the same session are ignored.
- The **Recent scans** list resets every 24 hours. **Close session** ends the session straight from this page.

9. Self check-in (projected QR code)

- Tap **Project** on a session to display a large session QR code on the lecture-hall screen. There is a clear **X** **Close** button on the projection page.
- Participants scan it with their phone camera, allow location access, enter their index number and are marked present.
- **Geofence:** the check-in only succeeds within 80 metres of the room, so a screenshot shared with someone off-campus will not work. Level mismatches are also rejected.

10. Student QR Portal

- One permanent portal link is shared with participants. They enter their index number and e-mail address and receive their unique QR code — no course selection needed.
- Codes issued in the past keep working for every past, present and future session.

11. Reports

- Choose a course, then pick **Daily** (a single week/date) or **Overall** (every week of that session combined).
- The grid marks **1** for a scan, **L** for a late arrival and **0** for no scan, with each column labelled by week and date.
- **At risk:** set the maximum number of misses you allow and QRoll lists who exceeded it and who passed.
- Every view exports exactly as shown — Excel, CSV or PDF, in QRoll colours.

12. Billing and plans

- A 14-day free trial, then: **\$6 / month**, **\$20 / semester (4 months)**, or **\$60 / year**. Prices are shown in your local currency where supported.
- Billing is currently switched off — every feature stays fully open and free until payments are activated.

13. Account settings

- Review the account you are signed in with, and link or unlink Google so you can use either sign-in method for the same account. Google is only linked while you are already signed in, which prevents account takeover.

14. Working offline

- QRoll installs to your phone home screen or desktop as an app (with the QRoll icon) and its interface is cached, so it opens instantly and survives brief network drops. Scanning and reporting need a connection to save to the database.

15. Data protection

- Every record is tied to your account through database-level security rules — no other account can read or change your data.
- See the in-app **Terms & Conditions** and **Privacy Policy** for the full statement.

16. Troubleshooting

- **Camera won't start:** allow camera access in the browser and tap **Start scanning** again.
- **Check-in rejected as too far:** move inside the room; the limit is 80 m.
- **Import found nothing:** make sure the first row contains headings such as Name, Index, Email, Level or Programme.
- **Student missing from a report:** they were never scanned for that date — the report shows 0 for them.
- **Still stuck:** reload the page; unsaved dialogs close and the app reconnects.
